

13 panel hair follicle drug test

13 panel hair follicle drug test is a comprehensive drug screening method that detects the presence of multiple substances in an individual's hair. This advanced testing technique is widely used in employment screening, forensic investigations, and substance abuse monitoring due to its ability to provide a longer detection window compared to urine or blood tests. The 13 panel test specifically screens for a broad range of drugs, making it an effective tool for identifying various types of drug use. This article delves into the details of the 13 panel hair follicle drug test, its testing process, substances detected, advantages, limitations, and preparation tips. Understanding these aspects can help individuals and organizations make informed decisions regarding drug testing protocols.

What is a 13 Panel Hair Follicle Drug Test?

The 13 panel hair follicle drug test is a type of drug screening that uses a small sample of hair to detect drug metabolites. Unlike traditional urine or blood tests, this method analyzes the hair shaft to identify drug use over an extended period, typically up to 90 days. It is highly regarded for its accuracy and ability to detect chronic usage rather than recent drug intake. The test derives its name from the fact that it screens for 13 different drug categories or substances, offering a broad spectrum of detection.

Purpose and Applications

This test is commonly employed by employers, law enforcement agencies, rehabilitation centers, and legal entities to monitor drug use. It is favored for its non-invasive collection process and resistance to tampering. The 13 panel hair follicle drug test serves as an effective deterrent against substance abuse and helps maintain safe and drug-free environments.

Drugs Included in the 13 Panel Hair Follicle Drug Test

The comprehensive nature of the 13 panel hair follicle drug test is reflected in the variety of substances it screens. These drugs are selected based on

their prevalence and potential impact on safety and productivity.

List of Drugs Tested

- Amphetamines (AMP)
- Methamphetamines (MET)
- Marijuana (THC)
- Cocaine (COC)
- Opiates (OPI) - including morphine and codeine
- Phencyclidine (PCP)
- Barbiturates (BAR)
- Benzodiazepines (BZO)
- Ecstasy/MDMA (MDMA)
- Methadone (MTD)
- Propoxyphene (PPX)
- Oxycodone (OXY)
- Tramadol (TML)

Each of these substances is detectable in hair samples due to the way drugs and their metabolites are deposited in the hair follicle from the bloodstream.

How the 13 Panel Hair Follicle Drug Test Works

The testing process involves collecting a hair sample, typically from the scalp, that is about 1.5 inches long and contains approximately 100-120 strands. This length represents roughly 90 days of hair growth, allowing for retrospective detection of drug use.

Sample Collection and Analysis

Hair samples are collected using sterile scissors, ensuring minimal discomfort. The sample is then sent to a laboratory where it undergoes washing to remove external contaminants before being chemically analyzed. The laboratory uses techniques such as immunoassay screening followed by gas chromatography-mass spectrometry (GC-MS) or liquid chromatography-tandem mass spectrometry (LC-MS/MS) for confirmation.

Detection Window

One of the key advantages of the 13 panel hair follicle drug test is its extended detection window. Drugs can be detected from approximately 7 days after use up to 90 days, which is significantly longer than urine or saliva tests. This makes it particularly useful for identifying long-term patterns of drug use.

Advantages of the 13 Panel Hair Follicle Drug Test

The 13 panel hair follicle drug test offers several benefits that contribute to its popularity in various sectors:

Key Benefits

- **Extended Detection Period:** Detects drug use over a 90-day span, capturing historical patterns.
- **Non-Invasive Collection:** Hair sample collection is simple, painless, and less intrusive than blood draws.
- **Resistance to Tampering:** Hair samples are difficult to adulterate compared to urine samples.
- **Comprehensive Screening:** Simultaneously tests for 13 different drugs, providing broad coverage.
- **Reliable and Accurate:** Laboratory confirmation methods minimize false positives and ensure validity.

Limitations and Considerations

While the 13 panel hair follicle drug test is highly effective, there are certain limitations and factors to consider when using this testing method.

Potential Drawbacks

Hair color, thickness, and cosmetic treatments can influence test results. For example, darker hair may retain more drug metabolites, potentially affecting detection levels. Additionally, very recent drug use within the past week may not be detected due to the time needed for drugs to incorporate into hair. External contamination, although minimized by washing procedures, can sometimes pose challenges.

Legal and Ethical Considerations

Employers and testing agencies must comply with regulations governing drug

testing, including informed consent and confidentiality. It is important to use the 13 panel hair follicle drug test as part of a broader drug monitoring program that respects individual rights and legal standards.

Preparation and What to Expect During Testing

Understanding the testing process can help individuals prepare and reduce anxiety associated with the 13 panel hair follicle drug test.

Before the Test

There is no special preparation required for hair follicle testing. It is advisable to avoid any hair treatments that could damage hair integrity, such as bleaching or excessive dyeing, shortly before the test. Informing the testing center of any prescription medications is also recommended.

During Sample Collection

A trained technician will collect a small hair sample from an inconspicuous area of the scalp, typically near the crown. The sample collection is quick and painless, usually taking only a few minutes. In cases where scalp hair is unavailable, body hair may be used, although this can affect detection windows.

After the Test

The laboratory analysis may take several days to complete. Results are typically reported as positive or negative for each drug panel. Confirmatory testing is performed to verify initial positive findings to ensure accuracy.

Frequently Asked Questions

What is a 13 panel hair follicle drug test?

A 13 panel hair follicle drug test is a type of drug screening that analyzes a small sample of hair to detect the presence of 13 different drugs or drug metabolites over a period of up to 90 days.

Which drugs are commonly tested in a 13 panel hair follicle drug test?

Common drugs tested include marijuana (THC), cocaine, amphetamines, methamphetamine, ecstasy (MDMA), opiates (such as heroin, codeine, morphine), phencyclidine (PCP), benzodiazepines, barbiturates, methadone, propoxyphene, oxycodone, and buprenorphine.

How far back can a 13 panel hair follicle drug test detect drug use?

A hair follicle drug test can typically detect drug use going back up to 90 days, as drugs incorporate into the hair shaft as it grows.

How is a 13 panel hair follicle drug test administered?

A small sample of hair, usually about 1.5 inches long and the width of a pencil, is cut close to the scalp from the crown of the head and sent to a laboratory for analysis.

Can a 13 panel hair follicle drug test be cheated or defeated?

It is very difficult to cheat a hair follicle drug test because the drugs are embedded inside the hair shaft. Attempts to bleach, dye, or shave hair may not be effective or may lead to test refusal or rescheduling.

How accurate is a 13 panel hair follicle drug test?

Hair follicle drug tests are highly accurate and have a low chance of false positives when performed by certified laboratories using standardized procedures.

How long does it take to get results from a 13 panel hair follicle drug test?

Results usually take between 3 to 5 business days after the laboratory receives the hair sample, depending on the lab's workload and testing methods.

Is the 13 panel hair follicle drug test more expensive than urine or saliva tests?

Yes, hair follicle drug tests tend to be more expensive than urine or saliva tests due to the complexity of the testing process and the longer detection window.

13 panel hair follicle drug test: Diary of a Phoenix Prairie Heart, 2022-01-10 Born cinched in the Bible Belt, I worked the land, loving God and family. I married my high school sweetheart in college. Time revealed him to be an alcoholic/addict. In love, I was desperate for his recovery. We met an intentional community having locations spanning the globe, their own government, a tall ship for trading overseas, organic farms, soap shops, biodiesel and solar energy. My husband joined. Alcohol and drugs were prohibited. I followed. I became ill. Touting sickness and death to be punishment for sin, their leaders proclaimed God smote me over insubordination to men. Years later I found proof God wasn't to blame, involved possibly. Something supernatural had transpired when I
