**free epilepsy training with certificate:** Neuroepidemiology in Resource-Limited Areas Ding Ding, Wenzhi Wang, Patrick Kwan, 2020-06-04 Neuroepidemiology is a branch of epidemiology involving the study of neurological disease distribution and determinants of frequency in human populations. Neuroepidemiology has been perceived for a long time as a science of incidence, prevalence, risk factors, natural history and prognosis of neurological disorders. However, the other integral part of neuroepidemiology is experimental neuroepidemiology, which is research based on clinical trials of effectiveness or efficacy of various interventions in neurological disorders. Neuroepidemiological researches have been conducted since 1960's, with the development of epidemiological methodology and advance of the clinical neurology. Most improvement of

neuroepidemiology was in western countries, largely in US and European countries. This study field has been developed quite late in resourcelimited areas, where 60% of world's populations are living in. Disease burden of neurological disorders, such as stroke, epilepsy, migraine, neurodegenerated diseases (AD, PD), multiple sclerosis (MS), amyotrophic lateral sclerosis (ALS), are extremely heavy in low and middle income countries (LAMICs), especially with the increasing aging population in these regions. Because of their progressive and disabling nature, these neurological disorders have major adverse personal, social, and economic consequences. Prevention and early detection are critical, because there are no cures and the clinical diagnosis typically occurs after substantial and often irreversible neuronal loss.

**free epilepsy training with certificate: Clinical Studies in Epilepsy** Leon Pierce Clark, 1917

**free epilepsy training with certificate: Evaluation of Clinical Biofeedback** Rogers, 2012-12-06 This comprehensive survey will be useful for anyone who seriously wants to learn more about the

current therapeutic status of biofeedback-therapists, physicians considering a referral, well-educated prospective patients, teachers, students, and research workers. But readers with different needs should use it in different ways. For a quick overview of a large field, one should turn to the Introduction and Summary and Conclusions sections. The reader interested in a specific disease should look for the proper section in the Table of Contents and then turn to the overall summary at the end of that section and also the briefer summaries that are given in the last paragraph of many subsections, whenever sufficient data are available. The reader who wants more information should read the entire chapter. The serious student or research worker, for whom the book will be most valuable, will want to read more of the main volume and at least to sample the Appendix to see the kinds of information that can be mined from it. When patients are satisfied with a new treatment and seem to be improved by it, why bother with any additional evaluation? The reason is that history has shown over and over again that new forms of treatment initially can be used enthusiastically for many conditions with apparent success, only to have the pendulum swing in the opposite direction from overenthusiasm to complete disillusionment.

Written for physicians, knowledgeable laypersons, and other professionals, *Complementary and Alternative Therapies for Epilepsy* bridges the worlds of traditional medicine and CAM to foster a broader perspective of healthcare for patients. The book respects cultural differences that may incorporate alternative medicine into a medical management program, and encourages patients to safely continue receiving necessary medical treatments. Wherever possible, scientific evidence supports the choice of treatment modalities, as well as the effectiveness of a combined traditional and CAM approach. Readers will find incisive discussions in sections on: Learning to Reduce Seizures Asian, Herbal and Homeopathic Therapies Nutritional Therapies Alternative Medical Therapies Oxygen Therapies Manipulation and Osteopathic Therapies Music, Art, and Pet Therapies From stress and epilepsy, to acupuncture, massage, craniosacral therapies, homeopathy, ketogenic diets, aromatherapy, hypnosis, and more, the book is all-inclusive and enlightening.
