ihealth glucose meter manual: *Diabetes Technology* Boris Draznin, 2019-06-17 We live in a century of technological revolution and the birth of artificial intelligence. Like every other sphere of

our life, diabetes-related technology is moving forward with lightning speed. New and improved insulin administration devices, increased capacity for monitoring one's blood glucose levels, and the ability to communicate directly with the device supplying insulin as well as with the patient and his/her healthcare provider have changed diabetes therapy forever. The problem is that diabetes-related technology is moving ahead much faster than physicians and other healthcare professionals can incorporate these advances into our practices. Diabetes Technology will consist of three parts: Part I addresses the clinical science of diabetes pumps, continuous glucose monitoring and communication technology with numerous practical aspects. Part III offers personal stories of healthcare providers who treat their own diabetes with modern diabetes technology. In particular, they will address how and why they decided to use this technology and the positive and negative aspects of their decision.
