practice group for short: Individual Differences in Movement D.B. Kirkcaldy, 2012-12-06

This book is an attempt to bridge the gap between differential psychology and human movement. It is curious that each discipline has received considerable attention in its own right but little effort has been made to cross-fertilize them. Some experimentalists view this union as the equivalent of committing academic adultery; they have tended to concentrate on general theories and models of motor control and movement, viewing individual differences as awkward and best assigned to the error variance component of an analysis. By neglecting person variables, valuable information is discarded: people do differ in terms of ability, attitude, motivation and temperament and it is hardly surprising that such differences interact with a variety of experimental and situational paradigms. The causes and determinants of individual differences must be examined at an interdisciplinary level, incorporating studies from experimental, physiological, clinical and educational psychology. This synthesis could not have been actualized by any single contributor. For this reason, a multi-authored approach has been adopted, in which 17 specialists have been assembled to present the current position of individual difference research in their respective disciplines. The authors were granted maximum freedom in their selection and presentation of material. What emerges is, hopefully, a novel and informative collection of articles addressed to a wide audience and providing an impulse for further research.

practice group for short: Reminiscence, Motivation, and Personality Hans Eysenck, 2012-12-06 This is a book on reminiscence, or more modestly a book on reminiscence in motor tasks, or more modestly still on reminiscence in pursuit rotor learning, with occasional references to other types of reminiscence. The vast majority of experiments investigating reminiscence with the pursuit rotor have been carried out within the framework of Hullian learning theory. Thus, of necessity, this book also will be much concerned with that theory. Some readers may feel that so much detailed attention paid to one piece of apparatus and one now rather discredited theory, is overdone; we could not agree with such an evaluation. There are several features of pursuit-rotor performance which make it particularly worthy of attention. One of the more important of these features is the easy replicability of many of the phenomena found in performance of this task; this is our first point. Replicability is the life blood of science; what cannot be replicated by any well-trained observer is of doubtful status in science, and on this score pursuit-rotor work certainly emerges as perhaps the most reliable set of observations in experimental psychology. The effects of massing and spacing; of rest pauses of different length; of switching from massed to spaced learning, or vice versa; of interpolating different activities; of introducing distracting stimuli; of switching from right to left hand, or vice versa; of changing the speed of rotation, or the diameter of the target disk these are clear-cut and replicable as few phenomena in psychology are.

I did it because I was a diligent student and I knew it was expected of me, but I didn't quite see the point. My practice in those days consisted of getting out my instrument, playing through a few times the music my teacher had assigned, and then calling it a day. When I messed up, I'd start over, trying to play without the mistake. Or sometimes I'd repeat the spot where I had tripped up once or twice to correct the mistake, and then I'd just go on. Anything that wasn't immediately made better by these two methods was essentially ignored. Maybe my teacher won't notice that I can't really play that part, I thought--

practice group for short: Multitasking: Executive Functioning in Dual-Task and Task Switching Situations Tilo Strobach, Mike Wendt, Markus Janczyk, 2018-03-27 Multitasking refers to performance of multiple tasks. The most prominent types of multitasking are situations including either temporal overlap of the execution of multiple tasks (i.e., dual tasking) or executing multiple tasks in varying sequences (i.e., task switching). In the literature, numerous attempts have aimed at theorizing about the specific characteristics of executive functions that control interference between simultaneously and/or sequentially active component of task-sets in these situations. However, these approaches have been rather vague regarding explanatory concepts (e.g., task-set inhibition, preparation, shielding, capacity limitation), widely lacking theories on detailed mechanisms and/or empirical evidence for specific subcomponents. The present research topic aims at providing a selection of contributions on the details of executive functioning in dual-task and task switching situations. The contributions specify these executive functions by focusing on (1) fractionating

assumed mechanisms into constituent subcomponents, (2) their variations by age or in clinical subpopulations, and/ or (3) their plasticity as a response to practice and training.
