sydney uni vet science: Parasites and Western Man R.J. Donaldson, 2012-12-06 The purpose of this book is to provide a concise account of those parasites which affect man in developed countries. Other textbooks relate mainly to the tropics and subtropics where parasites by comparison are more common. It is widely believed that this difference in prevalence between tropical and temperate countries is due to differences in climatic conditions alone. Whilst it is true that certain vectors can only act as transmitters of disease under climatic conditions found in the tropics, there are many other instances where climate per se is not a decisive factor. More often parasitic disease is related to the poor standards of hygiene, sanitation and nutrition, which characterize many of these tropical and subtropical areas. The advent of more international travel has added a new dimension to the study of parasites, with the appearance of rare and exotic parasitic infections in the West. This book encompasses the entire field of parasites in developed countries with a brief reference to other parts of the world whenever appropriate for the sake of completeness. Each chapter provides basic information as well as recent advances and current thinking. Thus the book will serve as an excellent, comprehensive introduction to those taking up a specialized interest in the subject, as well as those who may wish to obtain general information but are not actively working in the field. Although it is primarily written from a medical and veterinary stand point, it provides valuable material for other disciplines.

sydney uni vet science: Stress and Pheromonatherapy in Small Animal Clinical Behaviour Daniel S. Mills, Maya Braem Dube, Helen Zulch, 2012-10-11 Stress and Pheromonatherapy in Small Animal Clinical Behaviour is about how stress impacts on animal behaviour and welfare and what we can do about it, especially by using chemical signals more effectively. This readily accessible text starts from first principles and is useful to both academics and practitioners alike. It offers a framework for understanding how pheromonatherapy can be used to encourage desirable behaviour in dogs and cats and also a fresh approach to understanding the nature of clinical animal behaviour problems. The authors have pioneered the use of pheromone therapy within the field of clinical animal behaviour. As the culmination of many years of research and experience, they offer sound evidence-based advice on how and when pheromones can be used most effectively. The first part of the book deals with some fundamental concepts, focusing on the key concepts of stress, communication and perception. It then provides a framework for the evaluation of problem behaviour to allow consideration of the possible role or not of pheromonatherapy. Part 2 covers the application of these concepts to a range of specific situations, concentrating on conditions in which there has been most research to support the efficacy of pheromonatherapy. Suitable for veterinarians in small animal practice, students of clinical animal behaviour, veterinary nurses and technicians, as well as specialists and researchers in animal behaviour therapy.

sydney uni vet science: The Biology of Deer Robert D. Brown, 2012-12-06 The first International Conference on the Biology of Deer Production was held at Dunedin, New Zealand in 1983. That meeting provided, for the first time, a forum for those with interests in either wild deer management or farmed deer production to come together. Scientists, wild deer managers, domestic deer farmers, veterinarians, venison and antler product producers, and others were able to discuss common problems and to share their knowledge and experience. The relationships formed at that meeting, and the information amassed in the resulting Proceedings, sparked new endeavors in cervid research, management, and production. A great deal has taken place in the world of deer biology since 1983. Wild deer populations, although ever increasing in many areas of the world, face new hazards of habitat loss, environmental contamination, and overexploitation. Some species are closer to extinction than ever. Game managers often face political as well as biological challenges. Many more deer are now on farms, leading to greater concerns about disease control and increased needs for husbandry information. Researchers have accumulated considerable new information,

some of it in areas such as biochemical genetics, not discussed in 1983.
