tamu student research week: New Developments in Pathways Towards Diversity and Inclusion in STEM: A United States Perspective Alexander Gates, Juan Gilbert, Chris Botanga, Kim Nguyen, Bonita London, 2022-10-17 The Louis Stokes Alliances for Minority Participation (LSAMP) program of the US National Science Foundation has been a primary force for raising the success and graduation of minority students in STEM for 30 years. Increasing the number of underrepresented students earning baccalaureate degrees, and entering graduate school in STEM is the goal of LSAMP. This goal has been nearly achieved through the formation of alliances of degree granting institutions of higher learning, varying from community colleges to major research institutions. Currently there are 59 alliances including more than 400 institutions. LSAMP is responsible for more than 650,000 bachelor's degrees earned by minority students in STEM. The papers for this Research Topic should focus on the use of LSAMP activities, programs and collaborations to develop pathways to success and graduation of STEM majors from minority groups that underrepresented in STEM. These pathways can include any segment from pre-college through graduate school. Areas of special interest include mentoring, research experiences, transitions between levels and novel approaches for retention. The studies should be research based and rigorous. They can be pure research studies, curriculum and design or literature reviews but they must be at a cutting edge level and be subject to detailed review and assessment.

tamu student research week: Developing Metrics for Assessing Engineering Instruction National Academy of Engineering, Steering Committee for Evaluating Instructional Scholarship in

Engineering, 2009-05-15 Faculty in all disciplines must continually prioritize their time to reflect the many demands of their faculty obligations, but they must also prioritize their efforts in ways that will improve the prospects of career advancement. The current perception is that research contributions are the most important measure with respect to faculty promotion and tenure decisions, and that teaching effectiveness is less valued-regardless of the stated weighting of research, teaching and service. In addition, methods for assessing research accomplishments are well established, even though imperfect, whereas metrics for assessing teaching, learning, and instructional effectiveness are not as well defined or well established. *Developing Metrics for Assessing Engineering Instruction* provides a concise description of a process to develop and institute a valid and acceptable means of measuring teaching effectiveness in order to foster greater acceptance and rewards for faculty efforts to improve their performance of the teaching role that makes up a part of their faculty responsibility. Although the focus of this book is in the area of engineering, the concepts and approaches are applicable to all fields in higher education.

tamu student research week: Linked Courses for General Education and Integrative Learning Margot Soven, Dolores Lehr, Siskanna Naynaha, Wendy Olson, 2023-07-03 Research indicates that of the pedagogies recognized as “high impact”, learning communities – one approach to which, the linked course, is the subject of this book – lead to an increased level of student engagement in the freshman year that persists through the senior year, and improve retention. This book focuses on the learning community model that is the most flexible to implement in terms of scheduling, teacher collaboration, and design: the linked course. The faculty may teach independently or together, coordinating syllabi and assignments so that the classes complement each other, and often these courses are linked around a particular interdisciplinary theme. Creating a cohort that works together for two paired courses motivates students, while the course structure promotes integrative learning as students make connections between disciplines. This volume covers both “linked courses” in which faculty may work to coordinate syllabi and assignments, but teach most of their courses separately, as well as “paired courses” in which two or more courses are team taught in an integrated program in which faculty participate as learners as well as teachers. Part One, Linked Course Pedagogies, includes several case studies of specific linked courses, including a study skills course paired with a worldview course; a community college course that challenges students’ compartmentalized thinking; and a paired course whose outcomes can be directly compared to parallel stand-alone courses. Part Two, Linked Course Programs, includes a description of several institutional programs representing a variety of linked course program models. Each chapter includes information about program implementation, staffing logistics and concerns, curriculum development, pedagogical strategies, and faculty development. Part Three, Assessing Linked Courses, highlights the role of assessment in supporting, maintaining, and improving linked course programs by sharing assessment models and describing how faculty and administrators have used particular assessment practices in order to improve their linked course programs.
