taylor digital scale manual: Beyond Digital Mario Carpo, 2023-04-18 Recasting computational design: a new modern agenda for a post-industrial, post-pandemic world. Mass production was the core technical logic of industrial modernity: for the last hundred years, architects and designers have tried to industrialize construction and standardize building materials and processes in the pursuit of economies of scale. But this epochal march of modernity is now over. In *Beyond Digital*, Mario Carpo reviews the long history of the computational mode of production, showing how the merger of robotic automation and artificial intelligence will stop and reverse the modernist quest for scale. Today's technologies already allow us to use nonstandard building materials as found, or as made, and assemble them in as many nonstandard, intelligent, adaptive ways as needed: the microfactories of our imminent future will be automated artisan shops. The post-industrial logic of computational manufacturing has been known and theorized for some time. By tracing its theoretical and technical sources, and reviewing the design theories that accompanied its rise, Carpo shows how the computational project, long under the sway of powerful antimodern ideologies, is now being recast by the urgency of the climate crisis, which has vindicated its premises—and by the global pandemic, which has tragically proven its viability. Looking at the work of a new generation of designers, technologists, and producers, *Beyond Digital* offers a new modern agenda for our post-industrial future.

taylor digital scale manual: Time Perception and Dysfunction: Clinical and Practical Implications Deana Davalos, Giovanna Mioni, Simon Grondin, Felipe Ortuño, 2019-02-19

Processing time requires a complex set of abilities that dictates how one adapts to the environment. Timing is key in how we communicate, organize our space and understand the world. When timing is intact, it often exists below one's conscious awareness, but when one's ability to process time is disrupted, the effects are noticeable and widespread. To better understand the construct of temporal dysfunction, one has to examine the concept of timing from multiple angles. An integrative approach is required to understand the possible biological, cognitive and psychological etiologies of temporal dysfunction. In addition, expertise in language, measurement and psychopathology are necessary to comprehend how timing affects one's representation of the world. This Research Topic is dedicated to examining timing and temporal dysfunction across a variety of tasks and disorders. Specifically, we seek to understand the most basic types of timing dysfunction and how they may affect a wide range of behaviors and symptoms as well as higher levels of temporal deficits involved in how one perceives the time spent. This Research Topic represents the intersection of medicine, psychology, cognition and perception in a unified attempt to shed light on temporal processing. The collection of original research articles and case studies, highlighting novel methodologies and interventions, illustrates the complexity of timing dysfunction and how understanding these deficits helps us to get a fresh look at a wide range of clinical psychopathologies and to develop better interventions.
