## Understanding Lab Grown Diamonds

Lab grown diamonds, also known as synthetic or man-made diamonds, are diamonds produced in controlled laboratory environments using advanced technology. These diamonds possess the same physical, chemical, and optical properties as natural diamonds mined from the earth. The two primary methods for creating lab grown diamonds are High Pressure High Temperature (HPHT) and Chemical

Vapor Deposition (CVD). Both methods replicate the natural processes that form diamonds but in a significantly reduced time frame.

Lab grown diamonds are increasingly popular due to their ethical sourcing, environmental benefits, and often lower costs compared to natural diamonds. Despite being created artificially, these diamonds are composed of pure carbon arranged in a crystal lattice identical to that of natural diamonds. This similarity raises questions about whether lab grown diamonds will test real when subjected to standard diamond testing procedures.

## **How Diamonds Are Tested for Authenticity**

Diamond testing involves various techniques to confirm whether a gemstone is a genuine diamond or a simulant, such as cubic zirconia or moissanite. Common testing methods include thermal conductivity testing, electrical conductivity, and visual inspection using magnification. These tests exploit the unique properties of natural diamonds to distinguish them from imitations.

### **Thermal Conductivity Test**

This is one of the most widely used methods for diamond identification. Diamonds have high thermal conductivity, meaning they disperse heat quickly. Thermal testers, often handheld devices, measure how fast heat moves through a gemstone. Because most simulants do not conduct heat as efficiently, this test can identify many fake diamonds rapidly.

### **Electrical Conductivity Test**

Electrical conductivity testing is especially useful in distinguishing moissanite from diamonds. While diamonds are electrical insulators, moissanite conducts electricity. Specialized testers can exploit this difference to accurately differentiate between the two stones.

## Visual Inspection and Magnification

Expert gemologists use microscopes or loupes to examine internal characteristics such as inclusions, growth patterns, and fluorescence. These features can offer clues about whether a diamond is natural or lab grown. However, visual inspection alone is often insufficient for definitive identification without additional testing.

## Can Lab Grown Diamonds Pass as Real Diamonds?

Since lab grown diamonds share the same physical and chemical properties as natural diamonds, they generally will test real on standard diamond testers. Both natural and lab grown diamonds exhibit high thermal conductivity, so thermal testers typically cannot distinguish between them. This similarity means that simple testing equipment used in many retail settings may identify lab grown diamonds as natural diamonds.

However, specialized equipment and advanced testing procedures can detect the subtle differences between lab grown and natural diamonds. Despite this, for the average consumer or jeweler relying on basic diamond testers, lab grown diamonds often “test real.”

## Reasons Lab Grown Diamonds Test Real

- Identical carbon crystal structure to natural diamonds
- High thermal conductivity characteristic of genuine diamonds
- Similar optical properties including brilliance and fire
- Indistinguishable hardness at Mohs scale (10)

# Advanced Testing Techniques for Lab Grown vs Natural Diamonds

To definitively differentiate lab grown diamonds from natural ones, gemological laboratories and professionals use advanced analytical methods. These techniques analyze growth patterns, trace elements, and fluorescence under specific light conditions that reveal differences invisible to standard testers.

## Photoluminescence and Spectroscopic Analysis

Photoluminescence spectroscopy measures how a diamond absorbs and emits light at various wavelengths. Lab grown diamonds often exhibit distinct spectral lines or fluorescence patterns due to the conditions under which they were created. Natural diamonds have unique impurities and growth structures that produce different spectroscopic signatures.

## Diamond Type Identification

Diamonds are categorized into types (Type Ia, Ib, IIa, IIb) based on nitrogen content and other impurities. Lab grown diamonds frequently fall into Type IIa, which is less common among natural diamonds. Specialized equipment can detect these differences, assisting gemologists in classification.

## Inclusion Analysis

Inclusions are internal characteristics within diamonds. Lab grown diamonds often contain metallic inclusions from the manufacturing process or exhibit growth patterns characteristic of HPHT or CVD methods. Natural diamonds display different inclusion types formed over millions of years underground. Microscopic examination helps identify these distinctions.

## High-Resolution Imaging

Advanced imaging technologies, such as cathodoluminescence and infrared imaging, reveal detailed internal structures and growth zoning that differentiate lab grown diamonds from natural ones. These methods are typically employed in gemological laboratories rather than retail environments.

## Implications for Buyers and Jewelers

The fact that lab grown diamonds will test real on common diamond testers has significant implications for both buyers and jewelers. Transparency and disclosure become crucial to maintain trust and ensure proper valuation of diamonds in the market.

## Disclosure and Certification

Reputable sellers provide certification from recognized gemological laboratories that identify whether a diamond is natural or lab grown. Certificates often detail the diamond's origin, characteristics, and any treatments. Buyers should insist on such documentation to verify the nature of the diamond they are purchasing.

## Pricing and Value Considerations

Lab grown diamonds typically cost 30% to 50% less than their natural counterparts due to differences in rarity and production costs. Since lab grown diamonds test real, pricing must reflect the origin of the stone to avoid misleading consumers. Jewelers must educate customers about these distinctions to facilitate informed purchases.

## Resale and Insurance

Understanding whether a diamond is lab grown or natural affects resale value and insurance policies.

Lab grown diamonds may have different market demand and appraisal values. Accurate identification ensures proper coverage and expectations in secondary markets.

## **Summary of Key Points for Buyers and Jewelers**

- Lab grown diamonds can pass standard diamond tests as real diamonds
- Advanced gemological testing is required to distinguish lab grown from natural diamonds
- Certification and disclosure are essential for transparency
- Pricing, resale, and insurance considerations differ between lab grown and natural diamonds

## **Frequently Asked Questions**

### **Will lab grown diamonds test as real diamonds using standard diamond testers?**

Yes, lab grown diamonds are chemically, physically, and optically identical to natural diamonds and will test as real diamonds on standard diamond testers.

### **Can a jeweler tell the difference between a lab grown diamond and a natural diamond?**

Specialized equipment and trained gemologists can differentiate lab grown diamonds from natural ones by detecting growth patterns or trace elements, but standard testers cannot.

## **Do thermal conductivity diamond testers work on lab grown diamonds?**

Yes, thermal conductivity testers will register lab grown diamonds as real diamonds because lab grown diamonds have the same thermal properties as natural diamonds.

## **Are there any tests that can definitively identify lab grown diamonds?**

Yes, advanced methods like spectroscopy, photoluminescence, and ultraviolet light analysis can identify lab grown diamonds by revealing their unique growth characteristics.

## **Will a diamond tester confuse moissanite with a lab grown diamond?**

Diamond testers that measure thermal conductivity may confuse moissanite with diamonds, but newer testers that measure electrical conductivity can distinguish between moissanite and lab grown diamonds.

## **Can home diamond testers reliably identify lab grown diamonds?**

Most home diamond testers cannot reliably distinguish between lab grown and natural diamonds as both have similar properties detectable by these devices.

## **Are lab grown diamonds considered real diamonds by gemological standards?**

Yes, lab grown diamonds are considered real diamonds because they have the same physical, chemical, and optical properties as natural diamonds.

## **How can consumers be sure if their diamond is lab grown or natural?**

Consumers should request certification from reputable gemological labs that specify whether the diamond is lab grown or natural, as visual or simple tests are insufficient.

The book is more expansive and up-to-date than the author's earlier book, Beginner's Guide to Gemmology. The book deals with the practical and theoretical sides of gemmology. Tracing the background and science of gemmology, the book covers the gem material, geological formation, and occurrence of gemstones on the earth. The composition of gemstones from the atoms, elements, molecules, and compounds comprising them is analyzed, and the relationship between chemical composition and durability of the stone is explained. The basics of crystallography is mentioned as a tool toward understanding gemmology after which cleavage, parting, and fracture are done. A gemstone's durability and hardness and how the latter influences engineering tests and the mining techniques are compared. An important test technique to identify unmounted stones is the measure of specific gravity using displacement measurement methods and hydrostatic methods. After more descriptive details are given in identification of gemstones, whether these are synthetic or simulants, through a comprehensive explanation of the materials found in these other gemstones, the fashioning, through shaping or polishing, of gemstones is explained. Emphasis is given on the critical angle in which light rays pass in different rock densities, and then the cutting styles, gemstone polishing, and grading are discussed. Students studying for the Gemmological Association's Preliminary and Diploma examinations, jewelers, lapidarists, and diamond cutters, as well as those engaged in the hobby of gemmology, will find this book helpful and full of information toward their endeavors and hobbies.
